

## Environmental Impacts of Urbanisation ÷

Reducing soil moisture & intensification of  $\text{CO}_2$  emissions.

Global warming, Air pollution, Water scarcity, loss of forest cover, Agricultural land & depletion of wild life as a result of urban sprawl.

High level of Environmental Pollution such as air & noise pollution due to industries & automobiles. Water also gets polluted due to Industrial Waste Water discharge,

Due to lack of proper sewerage facility, crowded slums, <sup>open</sup> deposition of human waste, becomes breeding grounds for bacteria spreading Salmonella & Hepatitis disease. In most of the cities heavy rainfall totally upsets sewerage system.

Cities are warmer than villages due to concrete structure in the urban areas. which also leads to the problem of "Urban Heat Island".

### Government Steps →

- Habitat-III conference

It is a ~~also~~ acronym for major global summit formally known as United Nations conference on Housing & Sustainable Urban Development. The aim of the conference is to re-ignite the global political commitment

---

(audio issue)
